

number of them in a given census tract that exceed the cutoff. When well over one-half do so, we are especially alert to potential difficulties associated with the specific census tract deleted. In quite a few instances deletion of one observation out of the 506 makes a surprisingly large change as measured by external scale; for example, deletion of census tract 419 alone changes the CRIM coefficient by one standard deviation, and the deletion of census tract 381 changes DFFITS by 1.65 standard deviations. Thus, what we conceive to be extremely influential observations are discernible by "absolute" criteria even in a large data set.

#### APPENDIX 4A. THE HARRISON AND RUBINFELD HOUSING-PRICE DATA

The following are the data used for the analysis of the Harrison and Rubinfeld (1978) Housing-Price equation treated in Section 4.4. For identification of census tracts, see Exhibit 4.21. We are grateful to David Harrison and Daniel L. Rubinfield for making these data available.
